

11/12

- (1) Construct a Turing Machine that reverses its inputs
(Input - 0010111; Output - 1110100)

Turing Machine Components:-

Alphabet $S = \{\sqcup, 0, 1, *, 0', 1'\}$

External alphabet $A = \{0, 1\}$ ACS

States $Q = \{q_0, q_f, r_0, r_1, l_0, l_1, l_0', l_1'\}$

Transition function (δ):-

- Start from the left, from the starting position of the string
- Replace the character with symbol '*'; capture the state
- Proceed from left to right. Replace the Right character with the left one.
- Proceed from right to left and replace.
- Repeat above steps, till we reach the middle of the string.

states and their transitions

Start:-

$(q_0, 0) \rightarrow (r_0, *, +1)$

$(q_0, 1) \rightarrow (r_1, *, +1)$

$(q_0, \sqcup) \rightarrow (q_0, \sqcup, -1)$

Left to right movement:-

$(r_0, 0) \rightarrow (r_0, 0, +1)$ $(r_1, 0) \rightarrow (r_1, 1, +1)$

$(r_0, 1) \rightarrow (r_0, 1, +1)$ $(r_1, 1) \rightarrow (r_1, \sqcup, +1)$

Right to left:-

a) Replace the Right character with left

b) Proceed and correct the mark '*' with Right character.

a) change the direction from Right to left

$$(r_0, \sqcup) \rightarrow (l_0', \sqcup, -1)$$

$$(r_1, \sqcup) \rightarrow (l_1', \sqcup, -1)$$

$$(l_0', 0) \rightarrow (l_0, 0', -1) \quad (l_1', 0) \rightarrow (l_1, 1', -1)$$

$$(l_0', 1) \rightarrow (l_1, 0', -1) \quad (l_1', 1) \rightarrow (l_1, 1', -1)$$

$$(r_0, 0') \rightarrow (l_0', 0', -1) \quad (r_1, 0') \rightarrow (l_1', 0', -1)$$

$$(r_0, 1') \rightarrow (l_0', 1', -1) \quad (r_1, 1') \rightarrow (l_1', 1', -1)$$

b) Proceed from Right to left

$$(l_0, 0) \rightarrow (l_0, 0, -1) \quad (l_1, 0) \rightarrow (l_1, 0, -1)$$

$$(l_0, 1) \rightarrow (l_0, 1, -1) \quad (l_1, 1) \rightarrow (l_1, 1, -1)$$

c) Replace the marks * with Right character

$$(l_0, *) \rightarrow (q_0, 0, +1)$$

$$(l_1, *) \rightarrow (q_0, 1, +1)$$

d) End of the function

$$(l_0', *) \rightarrow (q_f, 0, +1)$$

$$(l_1', *) \rightarrow (q_f, 1, +1)$$

$$(q_f, 0') \rightarrow (q_f, 0, +1)$$

$$(q_f, 1') \rightarrow (q_f, 1, +1)$$

$$(q_f, \sqcup) \rightarrow \text{HALT}$$

1.5

Let $T(n)$ be the maximum number of steps performed by a Turing Machine with $\leq n$ states and $\leq n$ symbols before it terminates, starting with the empty tape. Prove that the function $T(n)$ grows faster than any Computable total function $b(n)$. $\lim_{n \rightarrow \infty} \frac{T(n)}{b(n)} = \infty$

Proof:-

Let M is a TM, with Θ states and S -symbols

$T =$ function for the number of steps

when $\Theta = S = n$

$T = T(n) =$ maximum number of steps taken by M before HALT

b is a Computable total function. So, there exists a TM, say, M' such that

$$M'(n) = b(n)$$

Say T' is the number of steps taken by M'

using same configuration Θ, S .

Since T is the maximum steps for n -symbol, n -state TM, $T' \leq T$

if T' is greater than T , then such TM, M' will not HALT. Because of this, we can say

there exist $N \in \mathbb{N}$, such that, $n \geq N$, function $T(n)$ grows much faster than $b(n)$

Example

For $S = \{1, L\}$, $A = \{1\}$ with n -states

for a given input n ,

number of maximum steps $T(n) = O[n]$ (unary representation)

\rightarrow Say b is a Computable function to convert n to binary using same S, A . Then complexity of such TM, M'

$$M'(n) = b(n) = O[\log n]$$

$A \cdot n$ grows higher $n \rightarrow \infty$, $O[n]$ grows faster than $O[\log n]$, therefore

$$\lim_{n \rightarrow \infty} \frac{T(n)}{b(n)} = \frac{O[n]}{O[\log n]} \rightarrow \infty$$

maybe we need lots of states to compute $b(n)$.
I don't think we can construct $T'(n) \leq T(n)$

3/4

Additional problem 1:

Write a TM that takes input as a binary number a (a string in 0 & 1) and outputs $(a-1)$ (in binary)

Turing Machine Components:-

Alphabet $S = \{\sqcup, 0, 1\}$
External Alphabet $A = \{0, 1\}$ ($A \subset S$)
States $Q = \{q_0, r_0, r_1, l_0, l_1, l_i, q_f\}$

Transition function (δ):-

1. Start from the left, traverse the input string to the right most
2. Capture the states for 0, 1 to the right end. If input string is all 0's, Halt.
3. If input string is (0's & 1's) start traversing from left to right
4. If we have 1 as right most, change to 0 and Halt
5. If we have 0 as right most, change to 1 and proceed left till we get 1 to change to 0 and Halt. Along the way, change 0 to 1.

States and their transitions:-

Start:-

$(q_0, 0) \rightarrow (r_0, 0, +1)$
 $(q_0, 1) \rightarrow (r_1, 1, +1)$

Traverse right:-

$(r_0, 0) \rightarrow (r_0, 0, +1)$
 $(r_0, 1) \rightarrow (r_1, 1, +1)$
 $(r_1, 0) \rightarrow (r_1, 0, +1)$
 $(r_1, 1) \rightarrow (r_1, 1, +1)$
 $(r_1, \sqcup) \rightarrow (l_0, \sqcup, -1)$

Traverse left:-

$(l_0, 0) \rightarrow (l_1, 1, -1)$
 $(l_0, 1) \rightarrow (l_1, 0, -1)$
 $(l_1, 0) \rightarrow (q_f, 0, -1)$
 $(l_1, 1) \rightarrow (q_f, 0, -1)$
 $(l_i, 0) \rightarrow (l_i, 1, -1)$
 $(l_i, 1) \rightarrow (l_i, 0, -1)$

HALT:-

$(r_0, \sqcup) \rightarrow (q_f, 0, -1)$

- a) If All zeros
- b) If we reach second from left If right most is 1
- c) If we reach 1 from left If right most is 0.

Sequence of Configurations:-

Ex-1

Start	q_0	1	1	0	0	1	(25)
$L \rightarrow R$		1	r_1	0	0	1	
"		1	1	r_1	0	1	
"		1	1	0	r_1	1	
"		1	1	0	0	r_1	
"		1	1	0	0	1	r_1
$L \leftarrow R$		1	1	0	0	l_0	
"		1	1	0	l_1	0	
Stop		1	1	q_f	0	0	(24)

Ex-2

Start	q_0	1	0	0	0	0	(16)
$L \rightarrow R$		1	r_1	0	0	0	
"		1	0	r_1	0	0	
"		1	0	0	r_1	0	
"		1	0	0	0	r_1	
"		1	0	0	0	0	r_1
$L \leftarrow R$		1	0	0	0	l_0	
"		1	0	0	l_1	0	
"		1	0	l_1	0	1	
"		1	0	0	1	1	
"		1	l_1	0	1	1	
"		l_1	1	1	1	1	
"		0	1	1	1	1	
Stop	q_f	0	1	1	1	1	(15)

Additional problem 2

Let $T = \{M \mid M \text{ is a Turing machine}\}$

Find a function $f: T \rightarrow \mathbb{N}$ such that if N and M are Turing machines and $f(N) = f(M)$ then $N = M$ (that is, N and M have the same alphabet, same transition function etc)

For a given TM, M , Transition function is the set of Configurations formed by states, symbols and shift

States $Q = \{q_0, q_1, \dots, q_{n_1}\}$

external Alphabet $A = \{a_1, a_2, \dots, a_{n_2}\}$

Alphabet $S = \{s_1, s_2, \dots, s_{n_3}\}$

blank symbol \sqcup

Transition function δ is a set of values over

$$\delta(q, sp) = (q', s', \Delta P) \quad \Delta P - \text{shift in position.}$$

In this case our function $f: T \rightarrow \mathbb{N}$ where

\mathbb{N} is the set of integers

we need to assign Integer to each value for Q, A, S

$Q_1 = n_1$ states

$A = n_2$ external alphabets

$S = n_3$ Symbols

By using the property :- Any number can be represented by factors of prime numbers, say, 2, 3, 5

we can represent each TM as

$$f(M) = 2^{n_1} \cdot 3^{n_2} \cdot 5^{n_3}$$

using same notation, we can say ✓

$$f(N) = 2^{n_1} \cdot 3^{n_2} \cdot 5^{n_3}$$

Since $f(M) = f(N)$

we can say Turing machines $N = M$.
