Homework 8

0	Reflection operator on the vector la>
	$D_{\alpha}(x) = e^{i\theta}(x) \text{if } L_{\alpha}(x) \neq 0$
	$= \pi\rangle \text{if } \langle \alpha \pi \rangle = 0$
	we saw in Grover's Algorithm,
	27 Po = (e'0-1)107x207x+I, then
	$p_0 x\rangle = e^{i\theta} 0\rangle + 2j = 0\rangle$
	10"> else
	In similar lines, of
	$D_{A} = \underbrace{(e^{i\theta}-1)}_{\alpha} _{A} \times A + I \text{where } \langle A A \rangle = \alpha \neq 0$
	then PAIAY = ((e10-1) 1A> <a> +1) 1A>
	All a
	$= \underbrace{e^{i\theta}_{A}}_{A} \underbrace{\langle A A \rangle - 1}_{A} \underbrace{\langle A A \rangle + 1}_{A} \underbrace{\langle A A \rangle + 1}_{A}$
	= e ¹⁰ (A)
	Say DalB> = ((e'0-1) A> <a> +] B> = (e'0-1) A><a b> + B></a b>
	$\frac{1}{a} = B\rangle (\langle A B\rangle = 0)$
	So we can say operator for DA can be written as
	DA = (e'0-1) [AXXA] + I Similarly for Istart > which
	a is a basis vector
	Circuit Ds = (e'e'-1) start > < start + I
	(circuit
	PA 10)
	$\begin{array}{c} & & & & & & & & & & & & & & & & & & &$
The same of the sa	

```
We know that <A/A> = a
(2)
                       (B|B) = b
            CI = AODOOAT
         G/4(x,B>) = -AODSOATODA/4(11)>
         We know that DAIA> = e101A>
             > PA14(xB)> = 4(e'0xB) -0
         A = A - | = A +
         => -AODOAT
           = -2/4(1,1)>(4(1,1)) + I - (2)
        From 0 & 2
            G| 4 (0, B)) = (2 |4(1,1) > < 4(1,1) |- I) |4(e x B) >
         Now we calculate
           < 4(1,1) | y(e'x B)>
                = (<A| + <B|) (e x | A) + B|B)
            = e ax + bB (: < A|A) = a; < B|B) = b) - 3
        Co (4(x,B)) = 2 (4(1)) (eax+bB) - 4(e'x,B))
           = | 4 (2e ax + 2bB - e a, 2e ax + 2bB-B))
           = 1 4((2a-1)ex+2bB, 2eax+(2b-1)B)>
       9 4 (1,1) = 14 ((2a-1)e+B, 2ea+(2b-1))
                  x = (2a-1) e'0+B
                  y = 2ea + (2b-1)
```
